11/09/2026 08:48:26	Dipak Prakash Dhangar	241107023	Open Track	Strata is a payment reliability engine that detects transaction degradation from Razorpay webhook data, identifies the dominant failure pattern using statistical analysis, and generates explainable, approval-gated recovery recommendations. Detection and failure attribution are deterministic, while an LLM is used only for root-cause synthe
11/09/2026 08:50:14	Madhuri Vipul Nerkar	251209014	AI Growth & Agentic Commerce	Project Name / Title * The Personal Shopping Assistant with Delegated Payments (BuyAgent). Project Objectives * What does it solve? The Personal Shopping Assistant with Delegated Payments (BuyAgent) solves fundamental user experience, security, and market efficiency problems that arise when AI moves from simply recommending products to taking actions and executing purchases. 1. The Friction of Manual Execution Problem: Traditional e-commerce requires users to conduct intent search across dozens of tabs, filter specifications, fill out forms, enter credit card details, and manually handle checkouts. Solution: Goal-Oriented Delegation. The user inputs a single natural-language directive ("Find trail running shoes under $120 with heel support, and purchase the best option"). The agent manages research, spec parsing, cart creation, and execution autonomously. 2. The AI Security & Trust Gap ("The Delegated Spend Problem") Problem: Users want AI to buy items for them, but giving an LLM full access to a credit card creates high risks of hallucination, accidental overspending, prompt injection attacks, or unauthorized recurring charges. Solution: Scoped, Cryptographic Authorization. BuyAgent integrates emerging delegated payment primitives—such as Stripe's Shared Payment Tokens (SPTs) and x402 payment rails. It allows users to delegate money under strict, programmatic constraints: Hard budget caps ("Do not spend more than $120 total including shipping"). Single-use digital transaction tokens instead of stored credit card numbers. Pre-checkout confirmation bounds that require human approval only if constraints change. 3. Cross-Platform Search & Commerce Fragmentation Problem: Products are scattered across walled gardens (Shopify, Amazon, niche direct-to-consumer sites), making cross-store comparison tedious. Solution: Unified Machine-Readable Aggregation. By connecting directly to open agent frameworks like the Agentic Commerce Protocol (ACP) and the Universal Commerce Protocol (UCP), BuyAgent queries structured product feeds (/.well-known/ucp or ACP APIs). It bypasses front-end UI clutter and ad-heavy search results to compare a 4. Overcoming "Ad-Biased" Recommendations Problem: Search engines and marketplaces often prioritize sponsored ads or sponsored placement over the item that actually matches the user's specific constraints. Solution: Objective Constraint Matching. BuyAgent evaluates product metadata (e.g., heel drop, weight, return policies, verified review summaries) objectively against the user's explicit prompt parameters rather than relying on search ad positioning.

It enables shopkeepers to record transactions using natural voice input, converts speech into structured financial data, and uses AI/ML for transaction understanding and classification. The system securely stores transaction
11/09/2026 08:56:12	Patil Deep Vinayak	241107042	AI Revenue Recovery	RevivePay Enterprise Sentinel is an AI-powered fintech platform designed to help merchants and B2B enterprises recover failed recurring payments, reduce chargebacks, and automate receivables. It uses intelligent payment-state management, fraud detection, idempotency, automated retry scheduling, and financial reconciliation to preve
11/09/2026 09:04:05	Sisodiya Mahima Milind	241107049	AI Revenue Recovery	RecoveryLoop AI is an autonomous payment failure recovery engine built for the Razorpay AI Buildathon (Track 3: AI Revenue Recovery). It automates the detection, diagnosis, and intervention of failed transactions to recover at-risk revenue without human intervention. Core Functionality Automated Root-Cause Diagnosis: Intercepts real-time payment failure webhooks and uses Amazon Bedrock (Claude 3 / Llama 3) to analyze error codes, transaction payloads, and merchant failure history. Deterministic Guardrail Execution: Validates AI recommendations against strict business rules to safely route recovery actions—such as dynamic payment retries, smart discount links, or customer outreach—preventing unauthorized transactions or hallucinations. Resilient Data & Audit Trail: Logs all transaction events, agent diagnoses, and recovery states to Supabase PostgreSQL with local in-memory fallbacks. Live Monitoring Dashboard: Features a Streamlit interface for real-time visualization of webhook feeds, system health metrics, and automated recovery performance. Tech Stack AI & Orchestration: Amazon Bedrock (Claude 3 / Llama 3) Backend: Python, FastAPI, Pydantic Database & Persistence: Supabase PostgreSQL Frontend: Streamlit Testing & Quality Assurance: Pytest (Unit & Integration) For a walkthrough on how AI agents handle automated payment recovery workflows in revenue protection platforms, you can review this AI Revenue Recovery Walkthrough. This video provides helpful visual context on state transitions and automated intervention pipelines used in failure recovery systems.
11/09/2026 09:10:37	Manish Vijay Patil	241109123	AI Revenue Recovery	Recovery Ledger is an AI agent for Razorpay's AI Buildathon (Track 03: AI Revenue Recovery) that diagnoses failed subscription payments, decides on a bounded recovery action, and executes it — logging every decision for audit. An LLM reasons about why each payment failed; a separate deterministic rules layer, grounded in real NPCI/R On a 90-case test batch, it recovered ₹78,979 against ₹2,31,710 at risk (34.1%) — ₹12,086 more than a naive "retry everything" baseline, using 23 fewer attempts and zero unsafe retries on unrecoverable payments (stolen cards, closed accounts). One-liner, if you need something shorter for a form field: An AI agent that diagnoses failed payments, applies compliant, bounded recovery rules, and recovers more revenue than blind retries — with a full audit trail for every decision.
11/09/2026 09:11:14	Lokesh Vijay Patil	231102086	AI Revenue Recovery	RecoverAI is an AI-powered revenue recovery system that detects failed or at-risk payments, diagnoses their causes, and automatically performs safe recovery actions using Razorpay test-mode APIs. It verifies recovery outcomes and maintains an audit trail, helping merchants reduce revenue loss and recover failed payments.

11/09/2026 10:27:51	Bharat Prashant Mahale	241107001	AI Revenue Recovery	RecoverAI is an AI-powered revenue recovery platform designed to help businesses recover revenue lost due to failed payments and overdue receivables. Instead of using the same retry strategy for every failed payment, RecoverAI analyzes each case using machine learning to estimate its recovery probability and Expected Recovery Value. Based on this information, the system intelligently selects the most suitable recovery action, such as a retry, payment link, alternate payment method, re To ensure safe automation, RecoverAI uses guardrails for high-value transactions, retry limits, cooldown periods, and other risk conditions. Cases that are not safe to automate are sent to a human-review workflow. The platform integrates with Razorpay Test Mode for Payment Link creation and provides a dashboard for monitoring live cases, recovery decisions, human reviews, analytics, and audit history. Key Buildathon Results: We built and evaluated RecoverAI on a controlled synthetic dataset covering 5,000 customers, 20,000 transactions, 5,000 invoices, and more than 96,000 checkout events. The final recovery pipeline evaluated 3,468 revenue-at-risk cases and demonstrated how AI-driven decisioning can combine automated recovery In simple terms, RecoverAI helps answer three questions for every revenue-at-risk case: Can this revenue be recovered? What is the best way to recover it? And is it safe to automate the recovery? We also successfully demonstrated two end-to-end recovery scenarios: a low-value failed payment can automatically trigger a Razorpay Test Mode Payment Link, while a high-value payment is stopped by the safety guardrails and routed to a human for approval before recovery execution. Every important decision and action is recorded in These results are based on synthetic data and controlled simulation and should not be interpreted as actual merchant revenue recovered in production.
11/09/2026 10:33:12	Nitin Gopal Beldar	241107008	AI Growth & Agentic Commerce	AI Buyer Agent is an AI-powered shopping assistant designed to make online shopping simpler, faster, and more personalized. Instead of manually searching through hundreds of products, comparing prices, checking availability, and then placing an order, users can simply tell the system what they are looking for in normal language. For example, a user can say, *"I need black semi-formal shoes for an office party under ₹3000."* The AI Buyer Agent understands these requirements, searches the available product inventory using semantic search, and presents the most relevant products to the user. It can then help the user compare products, check whether the selected Once the user selects a product, the system creates an order and uses Razorpay Test Mode** to handle the payment process. The payment is verified securely through the backend, after which the order and inventory are updated automatically. Users can then view their orders and track their current order status from the application. The project also includes an **admin/developer dashboard**, where administrators can manage products and inventory, monitor orders and payments, and view the activity of the AI agent. Important actions performed by the AI, such as product searches, stock verification, order creation, and payment-related operations, are recorded as to The main goal of the project is to demonstrate how an AI agent can move beyond simply recommending products and actually assist with the complete shopping journey — **from understanding a user's requirement to finding the right product, verifying availability, initiating payment, and tracking the order.
11/09/2026 11:29:17	Jidnyasa Namdeo Patil	241101068	Open Track	Webhook Causality Auditor is an AI-powered system that analyzes webhook events and reconstructs their actual sequence and relationships, even when events arrive late, out of order, or multiple times. It detects issues such as duplicate fulfillment, paid-but-unfulfilled orders, and inconsistent event states, while providing an evidence-base
11/09/2026 11:45:16	Pranali Amol Pawar	241101003	Open Track	My project is an AI-Based Virtual Interview Preparation and Evaluation Platform. It help users to do communication and listening practice on that platform. It helps students and job seekers practice interviews in a realistic environment and receive personalized feedback. The platform allows users to select options such as job role, interview difficulty, and interview mode. It supports different modes like Text-to-Text, Text-to-Voice, Voice-to-Text, and Voice-to-Voice interviews. Users can also upload their resume, provide a job description and self-description, and the system analyzes their profile to identify their skills, gaps, match score, interview questions, and a personalized improvement plan. After completing a mock interview, the AI evaluates the user's responses and provides feedback to help them improve their interview performance. Technologies used: MERN Stack, websocket, AI/LLM integration, Gemini/Groq APIs, and Web Speech/voice technologies.
11/09/2026 12:03:06	TEJAS SANJAY PATIL	241109102	AI Growth & Agentic Commerce	PayGate 402 AI agents could discover products, negotiate within merchant-defined limits, and make payments securely. The system uses AP2/x402 concepts, cryptographic mandates, replay protection, and a 5-checkpoint verification pipeline before settlement. 11/09/2026 23:12:09	Krushnai Chandrashekhar Borse	241101126	AI Risk Manager	RiskLens AI is an AI-powered enterprise risk management application designed to help users identify, assess, prioritize, and manage business risks. The frontend is developed using React and TypeScript. It contains modules such as the dashboard, risk register, risk assessment, analytics, risk simulator, and AI assistant. React Router is used for navigation between these modules. The backend is built using Node.js and Express.js. It provides REST APIs for authentication, risk management, AI analysis, and history. JWT is used for authentication, and passwords are securely hashed using bcrypt. MongoDB Atlas is used as the database, with Mongoose for schema management and database queries. Each risk is associated with the authenticated user's ID, so users can only access their own risk records. The AI functionality uses n8n as an automation layer. When a user asks a question, the backend verifies the user's authentication, retrieves their risk information from MongoDB, and sends the question and risk context to an n8n webhook. n8n connects this information with Gemini, which generates the AI response. The response is then re The main goal of the project is to combine traditional structured risk management with AI-assisted analysis so that users can understand their risks and make better mitigation decisions more efficiently.
