Question 13 of 34
A nightly job takes 40 minutes. While it runs, one CPU core sits at 100% and the other seven are idle, memory use is low and the disk is almost silent. Which change is most likely to cut the run time?
A. Add more RAM to the machine
B. Split the work so that several cores are used at once
C. Move the data to a faster SSD
D. Increase the network bandwidth

Question 12 of 34
A report should list every customer and, where they exist, their shipped orders. A developer writes:
SELECT c.CustomerId, o.OrderId
FROM Customer c
LEFT JOIN [Order] o ON o.CustomerId = c.CustomerId
WHERE o.Status = 'Shipped';
What does this query actually return?
A. Every customer, each repeated once for every order they ever placed
B. Every customer: those with no shipped order appear once with a NULL OrderId
C. An error, because o.Status can be NULL
D. Only customers that have at least one shipped order, because the WHERE clause throws away the NULL rows the outer join produced

Question 14 of 34
Two threads both need mutexes A and B. One takes A then B; the other takes B then A. Once in a while the program freezes with both threads stuck. Which change removes the cause rather than hiding it?
A. Give the lock calls a longer timeout
B. Make both mutexes recursive
C. Make every thread take the mutexes in the same fixed order
D. Raise the priority of one of the threads

Work the schedule out by hand. Six tickets arrive during a shift:
Ticket 1 2 3 4 5 6
Arrives at second 0 1 2 9 9 20
Work needed (seconds) 8 3 5 1 4 2
What is the total waiting time of all six tickets?
The rule again: one engineer, free from second 0. Whenever the engineer is free, among the tickets that have already arrived and are not started, start the one with the smallest work time; ties go to the smaller ticket number. If none has arrived, wait for the next arrival. A started ticket always runs to completion. Waiting time = start second − arrival second.
A. 23
B. 27
C. 32
D. 50

the Engineers !
Axiomtrix TestHub
Four submissions. Each one compiles under C++17 and prints a number. Exactly one is correct for every input allowed by the constraints (n up to 50000, arrivals up to 10^9, work up to 10^6).
// arrival[i], work[i] hold the input; order holds 0..n-1 sorted by arrival second,
// ties by ticket number. Only the scheduling part of each version is shown.
Version A
std::vector<int> byWork(n);
for (int i = 0; i < n; ++i) byWork[i] = i;
std::sort(byWork.begin(), byWork.end(), [&](int x, int y) {
if (work[x] != work[y]) return work[x] < work[y];
return x < y;
});
long long now = 0, total = 0;
for (int idx : byWork) {
if (arrival[idx] > now) now = arrival[idx];
total += now - arrival[idx];
now += work[idx];
}
std::cout << total << '\n';
Version B
std::priority_queue<std::pair<long long,int>,
std::vector<std::pair<long long,int>>,
std::greater<>> ready;

Coding 5 marks
Section brief : Coding
The scenario for all six questions in this section.
A help desk has exactly one engineer on duty. Tickets arrive during the shift: ticket i arrives at second a[i] and needs p[i] seconds of work. The
engineer is free from second 0 and follows one rule.
Whenever the engineer is free at time t:
look at every ticket that has already arrived (a[i] <= t) and has not been started;
if there is at least one, start the ticket with the smallest p[i]; if several share that value, start the one with the smallest ticket number (1-based
input order);
if there is none, the engineer waits, doing nothing, until the next ticket arrives and starts it then.
A started ticket always runs to completion — the engineer never switches in the middle. The waiting time of a ticket is the second it is started minus
the second it arrived. The program must print the total waiting time of all n tickets.
Input: line 1 is n; each of the next n lines is a[i] p[i], in ticket order. Output: one integer.
Constraints: 1 <= n <= 50000, 0 <= a[i] <= 1000000000, 1 <= p[i] <= 1000000. Time limit 1 second. Language: C++17.
Worked example. For the input

Attitude and Workplace Judgment 3 marks
Section brief – Attitude and Workplace Judgment
Question 33 of 34
You have been stuck for three hours on a build failure on your own machine. Nothing you have tried has worked. The team channel is busy with a production incident. What do you do next?
A. Keep working on it alone for the rest of the day and raise it at tomorrow's stand-up.
B. Give it one more short, bounded try, then post in the channel with the exact error, what you have already ruled out and what you need - and pick up another task while you wait.
C. Switch to another task and say nothing - the build may right itself once the incident is over.
D. Send a private message to the most senior engineer asking them to get on a call now and fix it with you.

Attitude and Workplace Judgment 3 marks
Question 31 of 34
Your first code review comes back with eleven comments. Most are small, two you genuinely do not understand, and one says "this whole function needs rewriting". The tone is blunt. The change is due in two days. What do you do?
A. Make every change exactly as asked, including the two you do not understand, so the review closes quickly.
B. Reply first with a detailed defence of your original design and wait for the reviewer's response before changing anything.
C. Merge as it is - the tests pass and the comments are opinions.
D. Make the changes you agree with, and reply on the two you do not understand asking what the reviewer would prefer and why.

Question 33 of 34
Two senior colleagues give you different instructions for the same afternoon. One says to finish the migration script first; the other says to drop it and fix a bug a customer has reported. Both sound urgent, neither knows what the other said, and your own deadline is tomorrow morning. What do you do?
A. Write both instructions in one short message to the two of them together, say what each one costs against tomorrow's deadline, and ask which comes first.
B. Do what your own lead asked, and tell the other colleague what you are doing and why.
C. Do whichever instruction arrived most recently, since it is probably the current priority.
D. Start both, so that neither colleague is left waiting.
