Question 39
00:05
Why can Weather component avoid a constructor?
It inherits state from App
It cannot receive props
It needs neither state initialization nor method binding
React creates its constructor inside render

DELL

Why can rerendering avoid actual DOM modification?
State updates directly modify browser nodes
Browser ignores unchanged React components
Reconciliation keeps unchanged elements and existing DOM
Fiber skips every child component automatically

Question 14 of 130

Why should internal navigation avoid normal anchors?

- Anchors cannot contain React components
- Anchors can reload the complete application document
- Anchors prevent browser history updates
- Anchors cannot point to relative paths

Question 36 of 130

Why can sort break immutable React data handling?

- It converts objects into numbers
- It removes duplicated values
- It mutates the original array
- It always reverses array order

00:08
Why use text for national identification values?
IDs may contain letters and numbers
Text creates automatic uniqueness
Text values consume no database storage
Integers cannot become foreign keys

Question 21 of
What actually controls a controlled form value?
The submit event permanently stores the value
React state supplies the value and receives changes
The input element owns value independently from React
The browser DOM independently stores the final value

Next q
DELL

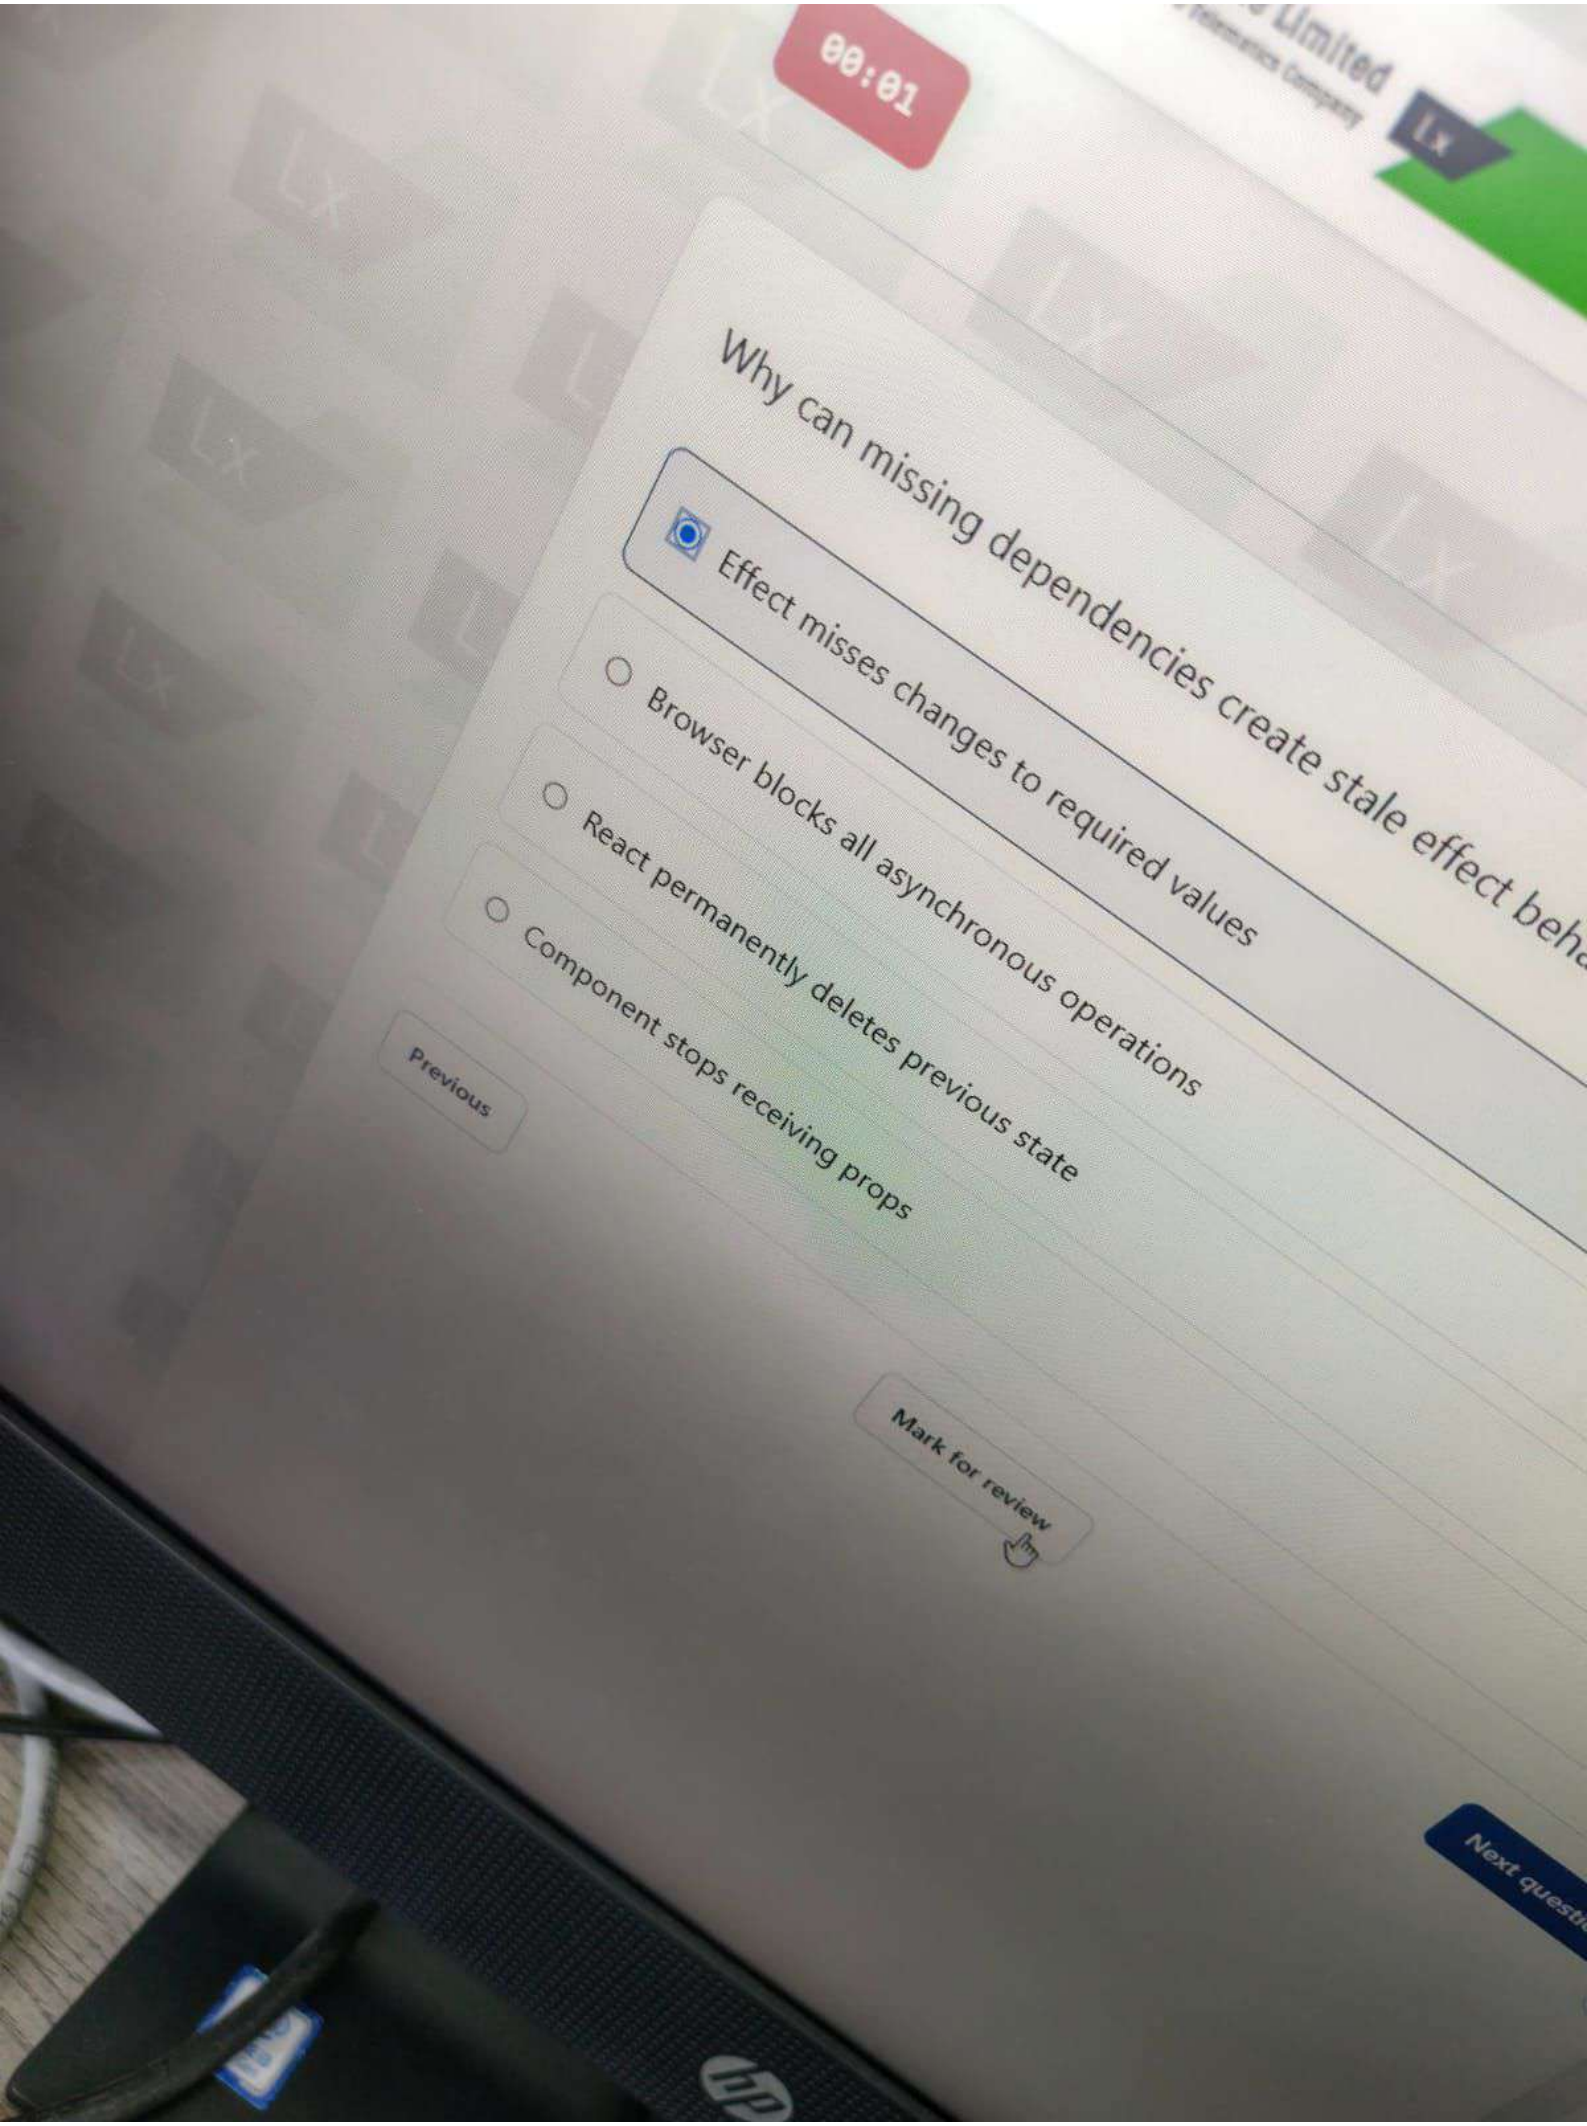

How can one value be both state and props?
Both components independently create identical state values
Props become state whenever the child renders them
A child automatically converts received props into state
Parent owns state while child receives it as props

Question 35 of 130
Why can custom hooks still leave UI duplication?
Hooks cannot return event handlers
Hooks reuse logic but not complete JSX structure
Hooks cannot maintain independent state
Hooks force every component to share state
Previous

Next question

00:01
Why can missing dependencies create stale effect beha
Effect misses changes to required values
Browser blocks all asynchronous operations
React permanently deletes previous state
Component stops receiving props
Previous

Automation & Telematics Company
Why does React delegate events to the root?
Central handling reduces repeated event registrations
Root events skip bubbling completely
Synthetic events require document-level handlers
Components cannot directly receive browser events
